WordPress Integration Brief

Last Frontier Heliskiing — AI Chat Widget

FOR GWYN

WHAT WE'VE BUILT

We've developed a custom AI-powered chat widget for Last Frontier Heliskiing. It answers guest questions about tours, lodges, pricing, safety, and more — using the official LFH knowledge base.

Everything is hosted on a **dedicated CDN** (GitHub Pages). This means the widget's code, styling, fonts, and images are all served from one central location. If we need to make any changes — update content, fix a bug, tweak styling — we update the CDN. **No WordPress changes needed.**

THE EMBED CODE

A single script tag is all that's needed. It loads the widget, all extensions, and styling automatically.

ADD TO EVERY PAGE — BEFORE </BODY>

```
<!-- Last Frontier AI Chat Widget -->
<script type="module"
  src="https://yannicksegaar.github.io/lfh-cdn/loader.js?v=1.
1.0"
></script>
```

WordPress tip: The easiest approach is to add this in the theme's footer template (`footer.php`) or via a plugin like *Insert Headers and Footers | WPCode*. This ensures it loads on every page site-wide.

> ⚠ **IMPORTANT — DO NOT DEPLOY YET**
>
> We are still finalising integration and incorporating Steve's feedback. I need the **definite green light from Steve** before the widget goes live on the website. I'm expecting to meet with Steve shortly to confirm. Until then, please **do not add**

> **the script to the production site**. I will let you know the moment we're clear to go.

INTEGRATION STEPS (WHEN READY)

1. **Add the script** to the WordPress site footer (loads on all pages).
2. **Verify** the chat widget appears in the bottom-right corner after a few seconds.
3. **Test** by clicking the widget and sending a message — you should get a response from the AI agent.
4. **Done.** All future updates happen via the CDN — no code changes needed on WordPress.

LIVE PREVIEW & TEST PAGE

We've built a test page that loads the widget from the CDN — exactly as it would appear on the LFH website. It verifies all assets load correctly and shows the full widget experience.

Test page	yannicksegaar.github.io/lfh-cdn/test.html
CDN root	yannicksegaar.github.io/lfh-cdn/
Loader script	`loader.js` — orchestrates widget, extensions, styling

HOW THE CDN ARCHITECTURE WORKS

The WordPress site only has the one script tag. That script pulls everything from the CDN:

Widget engine	VoiceFlow chat widget (loaded from VoiceFlow's CDN)
Styling	Custom CSS + Shadow DOM injection for brand colours, fonts, layout
Extensions	9 custom modules — tour explorer, lodge comparison, lead capture, feedback, etc.

Brand assets	LFH logo, fonts (Nexa Rust Sans), background images

Any change we make to the CDN is immediately reflected on the website — no WordPress deployment needed.
